MOLD CLEANING & PREVENTION

**BLEACH** does not kill mold on porous surfaces such as drywall, fabric, or wood. Use **white vinegar** instead.

**WHITE VINEGAR INSTRUCTIONS**

For use on drywall, fabric or wood:

1. Pour pure white **vinegar** into a spray bottle.
2. Spray the vinegar on mold area and leave for 1 hr.
3. Whenever possible let air dry, if not, wipe surface until dry.

*You can also use vinegar to prevent mold growth. Just spray vinegar on surface and leave it. Repeat this every few days to stay mold-free. Any smell from the vinegar should clear within a few hrs.*

---

BLEACH INSTRUCTIONS

For use on non porous surfaces: Glass, metal or plastic:

1. **Bleach** produces fumes, wear a mask and make sure the area is well ventilated before you begin. Wear gloves to protect your hands.

2. For killing mold with bleach use a ratio of one cup of bleach per gallon of water (= about 1 part bleach to 10 parts water).

3. Apply the diluted bleach mix to mold, either by using a spray bottle or by using a bucket and sponge/cloth. You don't need to rinse the surface afterwards (unless it is used for food preparation or a surface which may be touched by small children or pets) as the bleach will inhibit mold growing in the future.
